Short media bio

Eduard Takhunts is the founder of Eldercare Robotics and creator of Luka Bear, an AI-enabled, non-medical assistive-technology platform inspired by his experience caring for his father with Alzheimer's disease. His work combines conversational AI, caregiver applications, product architecture, privacy documentation, deployment, and commercialization to support practical person-centered care.

Expanded bio

Eduard Takhunts is a founder, product architect, and AI/assistive-technology strategist based in the Washington, DC metropolitan area. He created Luka Bear after his family needed a calm, familiar source of support for his father, who lives with Alzheimer's disease. What began as a personal prototype developed into a connected platform that combines biography-informed conversation, routines, reminders, engagement activities, caregiver-configured workflows, remote presence, device controls, and implementation evidence.

Through Eldercare Robotics, Eduard leads product definition, software and caregiver-app development, hardware integration, privacy and compliance documentation, home and care-community implementation, reimbursement-readiness research, and commercialization. His public work also includes the Caregiver Mental Health Journal, the Luka Bear Podcast, and a Caregiver Impact and Reimbursement Portal. Luka Bear is positioned as a non-medical functional assistive-technology and general-wellness product, not as a replacement for medical judgment or emergency services.

SELECTED INTERVIEW TOPICS

- Building care technology from lived caregiving experience
- Practical AI for daily and overnight routines
- Caregiver tools and authorized remote presence
- Privacy-aware assistive technology
- Founder-led implementation and commercialization

CURRENT PUBLIC PROOF

- Active Luka Bear product and caregiver platform
- 14-day free trials and subscription service
- Home and care-community implementation
- Active podcast, product videos, and caregiver journal
- Public evidence and reimbursement portal
